

IN THE CLAIMS:

1. (currently amended) A method of managing a delivery schedule of an order using a system configured with a server which includes a goods delivery system, the system including at least one computing unit networked to the server, the order being delivered from at least one supplier to a respective delivery agent, and from the respective delivery agent to a respective buyer, wherein the order comprises order information, said method comprising the steps of:

(1) calculating a first potential arrival date of the order to a respective delivery agent's location using the server system based on an order request date, a respective buyer's address, and a fixed delay;

(2) determining an ability of the respective delivery agent to ship the order based on the first potential arrival date and a number of slots to be shipped, the number of slots calculated from a work unit matrix;

(3) determining a delivery date to the respective buyer when there is sufficient delivery agent capacity to ship the order to the respective buyer's address;

(4) updating an electronic manifest indicating the delivery date of the order and a change in delivery agent capacity for the delivery date; and

(5) allowing an order change that affects the delivery date of the order to be made by a user that is authorized by one of the respective delivery agent, the respective buyer, the at least one supplier, a store, or a logistics intermediary, wherein allowance of the order change is based on: (a) a type of order change, (b) whether the user is acting as the respective delivery agent, the respective buyer, the at least one supplier, the store, or the logistics intermediary, (c) a level of the user, and (d) a security code, wherein, upon allowance of the order change, steps (1), (2), (3) and (4) are repeated to determine a new delivery date.

2. (canceled)

3. (canceled)

4. (currently amended) The method of managing the delivery schedule as recited in ~~claim 3~~ claim 1, further comprises the step of multiplying each item in the order by a work unit selected from the work unit matrix to determine the number of slots for the order.

5. (currently amended) The method of managing the delivery schedule as recited in ~~claim 3~~ claim 1, wherein the step of determining a delivery date to the respective buyer when there is sufficient capacity to ship the order further comprises the step of determining a first available date to completely ship the order to the respective buyer based on a capacity matrix and based on a number of available slots.

6. (canceled)

7. (currently amended) The method of managing the delivery schedule as recited in ~~claim 3~~ claim 1, further comprising the step of getting a zip code to which the order is to be delivered and a brand of a respective good in the order.

8. (previously presented) The method of managing the delivery schedule as recited in claim 7, further comprising the step of getting the supplier ship schedule based on the zip code and the brand of the respective good ordered.

9. (previously presented) The method of managing the delivery schedule as recited in claim 8, further comprising the step of selecting the respective delivery agent and a respective capacity matrix based on the zip code of the order.

10. (previously presented) The method of managing the delivery schedule as recited in claim 9, further comprising the step of determining a first potential ship date to the respective buyer's address based on the capacity of the respective delivery agent and the delivery schedule of the respective delivery agent.

11. (previously presented) The method of managing the delivery schedule as recited in claim 1, wherein the step of allowing an order change that affects the delivery date of the

order to be made further comprises the step of allowing the order change to be made using an external order interface.

12. (original) The method of managing the delivery schedule as recited in claim 1, further comprising the step of updating the electronic manifest with status information.

13. (canceled)

14. (previously presented) The method of managing the delivery schedule as recited in claim 1, wherein the step of calculating a first potential arrival date of the order to a respective delivery agent's location further comprises calculating a first potential arrival date of the order, wherein the order information comprises the order request date, a model number, a quantity of items, a brand of an item, a service to be selected, a requested delivery date, the respective buyer's delivery address, a security level clearance, and status information.

15. (currently amended) A method of managing a delivery schedule of an order using a system configured with a server which includes a goods delivery system, the system including at least one computing unit networked to the server, the order being delivered from at least one supplier to a respective delivery agent, and from the respective delivery agent to a respective buyer, wherein the order comprises order information, said method comprising the steps of:

(1) calculating a first potential arrival date of the order to a respective delivery agent's location using the server system based on an order request date, a respective buyer's address, and a fixed delay;

(2) determining an ability of the respective delivery agent to ship the order within a set of potential delivery dates based on the first potential arrival ~~date and date~~, a first date the respective delivery agent is prepared to ship the order, and a number of slots to be shipped, the number of slots calculated from a work unit matrix;

(3) selecting an actual delivery date from the set of potential delivery dates;

(4) updating an electronic manifest indicating the actual delivery date of the order and a change in delivery agent capacity for the delivery date; and

(5) allowing an order change that affects the actual delivery date of the order to be made by a user that is authorized by one of the respective delivery agent, the respective buyer, the at least one supplier, a store, or a logistics intermediary, wherein allowance of the order change is based on: (a) a type of order change, (b) whether the user is acting as the respective delivery agent, the respective buyer, the at least one supplier, the store, or the logistics intermediary, (c) a level of the user, and (d) a security code, wherein, upon allowance of the order change, steps (1), (2), (3) and (4) are repeated to determine a new actual delivery date.

16. (canceled)

17. (canceled)

18. (currently amended) The method of managing the delivery schedule as recited in ~~claim 17~~ claim 15, further comprising the step of multiplying each item in the order by a work unit selected from the work unit matrix to determine the number of slots for the order.

19. (currently amended) The method of managing the delivery schedule as recited in ~~claim 17~~ claim 15, wherein the step of selecting an actual delivery date from the set of potential delivery dates further comprises the step of determining a first available date to completely ship the order to the respective buyer based on a capacity matrix and based on a number of available slots.

20. (canceled)

21. (currently amended) The method of managing the delivery schedule as recited in ~~claim 17~~ claim 15, further comprising the step of getting a zip code to which the order is to be delivered and a brand of a respective good in the order.

22. (previously presented) The method of managing the delivery schedule as recited in claim 21, further comprising the step of getting the respective supplier ship schedule based on the zip code and the brand of the respective good ordered.

23. (previously presented) The method of managing the delivery schedule as recited in claim 22, further comprising the step of selecting the respective delivery agent and a respective capacity matrix based on the zip code of the order.

24. (previously presented) The method of managing the delivery schedule as recited in claim 23, further comprising the step of determining a first potential ship date to the respective buyer's address based on the capacity of the respective delivery agent and a delivery schedule of the respective delivery agent.

25. (previously presented) The method of managing the delivery schedule as recited in claim 15, wherein the step of calculating a first potential arrival date of the order to a respective delivery agent's location further comprises calculating a first potential arrival date of the order, wherein the order information comprises the order request date, a model number, a quantity of items, a brand of an item, a service to be selected, a requested delivery date, the respective buyer's delivery address, a security level clearance, and status information.

26. (currently amended) A computer program storage medium readable by a computer system and encoding a computer program of instructions for executing a computer process for managing deliveries of a goods delivery system, the system employed to deliver an order from at least one supplier to a respective delivery agent, and from the respective delivery agent to a respective buyer, given order information, said computer process comprising the steps of:

(1) determining a first potential arrival date of the order to a respective delivery agent's location, based on an order request date, a respective buyer's address, and a fixed delay;

(2) determining an ability of the respective delivery agent to ship the order based on the first potential arrival date and a number of slots to be shipped, the number of slots calculated from a work unit matrix;

(3) determining a delivery date to the respective buyer when there is sufficient delivery agent capacity to ship the order to the respective buyer's address;

(4) updating an electronic manifest indicating the delivery date of the order and a change in delivery agent capacity for the delivery date; and

(5) allowing an order change that affects the delivery date of the order to be made by a user that is authorized by one of the respective delivery agent, the respective buyer, the at least one supplier, a store, or a logistics intermediary, wherein allowance of the order change is based on: (a) a type of order change, (b) whether the user is acting as the respective delivery agent, the respective buyer, the at least one supplier, the store, or the logistics intermediary, (c) a level of the user, and (d) a security code, wherein, upon allowance of the order change, steps (1), (2), (3) and (4) are repeated to determine a new delivery date.

27. (canceled)

28. (canceled)

29. (currently amended) The computer process as recited in ~~claim 28~~ claim 26, further comprises the step of multiplying each item in the order by a work unit selected from the work unit matrix to determine the number of slots for the order.

30. (previously presented) The computer process as recited in claim 29, wherein the step of determining a delivery date to the respective buyer when there is sufficient capacity to ship the order further comprises the step of determining a first available date to completely ship the order to the respective buyer based on a capacity matrix and based on the number of available slots.

31. (canceled)

32. (currently amended) The computer process as recited in ~~claim 28~~ claim 26, further comprising the step of getting a zip code to which the order is to be delivered and a brand of a respective good in the order.

33. (previously presented) The computer process as recited in claim 32, further comprising the step of getting the supplier ship schedule based on the zip code and the brand of the respective good ordered.

34. (previously presented) The computer process as recited in claim 33, further comprising the step of selecting the respective delivery agent and a respective capacity matrix based on the zip code of the order.

35. (previously presented) The computer process as recited in claim 34, further comprising the step of determining a first potential ship date to the respective buyer's address based on the capacity of the respective delivery agent and the delivery schedule of the respective delivery agent.

36. (previously presented) The computer process as recited in claim 26, wherein the step of allowing an order change that affects the delivery date of the order to be made further comprises the step of allowing the order change to be made using an external order interface.

37. (original) The computer process as recited in claim 36, further comprising the step of updating the electronic manifest with status information.

38. (canceled)

39. (previously presented) The computer process as recited in claim 26, wherein the step of determining a first potential arrival date of the order to a respective delivery agent's location further comprises determining a first potential arrival date of the order, wherein the order information comprises the order request date, a model number, a quantity of items, a brand of an item, a service to be selected, a requested delivery date, the respective buyer's delivery address, a security level clearance, and status information.

40. (currently amended) An apparatus for managing the delivery of an order from at least one supplier to a respective delivery agent, and from the respective delivery agent to a respective buyer, given order information, said apparatus comprising:

means for determining a first potential arrival date of the order to a respective delivery agent's location, based on an order request date, a respective buyer's address, and a fixed delay;

means for determining an ability of the respective delivery agent to ship the order based on the first potential arrival date and a number of slots to be shipped, the number of slots calculated from a work unit matrix;

means for determining a delivery date to the respective buyer when there is sufficient delivery agent capacity to ship the order to the respective buyer's address;

means for updating an electronic manifest indicating an order ship date and a change in delivery agent capacity for the delivery date; and

means for allowing an order change that affects the delivery date of the order to be made by a user that is authorized by one of the respective delivery agent, the respective buyer, the at least one supplier, a store, or a logistics intermediary, wherein allowance of the order change is based on: (a) a type of order change, (b) whether the user is acting as the respective delivery agent, the respective buyer, the at least one supplier, the store, or the logistics intermediary, (c) a level of the user, and (d) a security code, wherein, upon allowance of the order change, said apparatus determines a new delivery date and updates the electronic manifest.

41. (currently amended) A method of managing a delivery schedule of a multiple brand order using a system configured with a server which includes a goods delivery system, the system including at least one computing unit networked to the server, the multiple brand order being delivered from at least two suppliers to a respective delivery agent, and from the respective delivery agent to a respective buyer, wherein the multiple brand order comprises order information, said method comprising the steps of:

(1) calculating a first potential arrival date of the multiple brand order to a respective delivery agent's location using the server system based on an order request date, a respective buyer's address, and a fixed delay;

(2) determining an ability of the respective delivery agent to ship the multiple brand order from the at least two suppliers based on the first potential arrival date and a number of slots to be shipped, the number of slots calculated from a work unit matrix;

(3) determining a delivery date to the respective buyer when there is sufficient delivery agent capacity to ship the multiple brand order to the respective buyer's address;

(4) updating an electronic manifest indicating the delivery date of the multiple brand order and a change in delivery agent capacity for the delivery date; and

(5) allowing an order change that affects the delivery date of the multiple brand order to be made by a user that is authorized by one of the respective delivery agent, the respective buyer, the at least two suppliers, a store, or a logistics intermediary, wherein allowance of the order change is based on: (a) a type of order change, (b) whether the user is acting as the respective delivery agent, the respective buyer, one of the at least two suppliers, the store, or the logistics intermediary, (c) a level of the user, and (d) a security code, wherein, upon allowance of the order change, steps (1), (2), (3) and (4) are repeated to determine a new delivery date.

42. (canceled)

43. (canceled)

44. (currently amended) The method of managing the delivery schedule as recited in ~~claim 43~~ claim 41, further comprises the step of multiplying each item in the multiple brand order by a work unit selected from the work unit matrix to determine the number of slots for the multiple brand order.

45. (currently amended) The method of managing the delivery schedule as recited in ~~claim 43~~ claim 41, wherein the step of determining a delivery date to the respective buyer

when there is sufficient capacity to ship the multiple brand order further comprises the step of determining a first available date to completely ship the multiple brand order to the respective buyer based on a capacity matrix and based on the number of available slots.

46. (canceled)

47. (currently amended) The method of managing the delivery schedule as recited in ~~claim 43~~ claim 41, further comprising the step of getting a zip code to which the multiple brand order is to be delivered and a brand of at least one respective good in the multiple brand order.

48. (previously presented) The method of managing the delivery schedule as recited in claim 47, further comprising the step of getting each of the supplier ship schedules based on the zip code and the brand of the at least one respective good ordered.

49. (previously presented) The method of managing the delivery schedule as recited in claim 48, further comprising the step of selecting the respective delivery agent and the respective capacity matrix based on the zip code of the multiple brand order.

50. (previously presented) The method of managing the delivery schedule as recited in claim 49, further comprising the step of determining a first potential ship date to the respective buyer's address based on the capacity of the respective delivery agent and the delivery schedule of the respective delivery agent.

51. (currently amended) A method of managing a delivery schedule of a multiple brand order using a system configured with a server which includes a goods delivery system, the system including at least one computing unit networked to the server, the order being delivered from at least two suppliers to a respective delivery agent, and from the respective delivery agent to a respective buyer, wherein the multiple brand order comprises order information, said method comprising the steps of:

(1) calculating a first potential arrival date of the multiple brand order to a respective delivery agent's location using the server system based on an order request date, a respective buyer's address, and a fixed delay;

(2) determining an ability of the respective delivery agent to ship the multiple brand order from the at least two suppliers based on the first potential arrival date and a number of slots to be shipped, the number of slots calculated from a work unit matrix;

(3) determining a delivery date to the respective buyer when there is sufficient delivery agent capacity to ship the multiple brand order to the respective buyer's address;

(4) updating an electronic manifest indicating the delivery date of the multiple brand order and a change in delivery agent capacity for the delivery date; and

(5) allowing an order change that affects the delivery date of the multiple brand order to be made by a user that is authorized by one of the respective delivery agent, the respective buyer, the at least two suppliers, a store, or a logistics intermediary, wherein allowance of the order change is based on: (a) a type of order change, (b) whether the user is acting as the respective delivery agent, the respective buyer, one of the at least two suppliers, the store, or the logistics intermediary, (c) a level of the user, and (d) a security code, wherein, upon allowance of the order change, steps (1), (2), (3) and (4) are repeated to determine a new delivery date.

52. (canceled)

53. (canceled)

54. (previously presented) The method of managing the delivery schedule as recited in ~~claim 53~~ claim 51, further comprises the step of multiplying each item in the multiple brand order by a work unit selected from the work unit matrix to determine a number of slots for the multiple brand order.

55. (currently amended) The method of managing the delivery schedule as recited in ~~claim 53~~ claim 51, wherein the step of determining a delivery date to the respective buyer

when there is sufficient capacity to ship the multiple brand order further comprises the step of determining a first available date to completely ship the multiple brand order to the respective buyer based on a capacity matrix and based on the number of available slots.

56. (canceled)

57. (currently amended) The method of managing the delivery schedule as recited in ~~claim 53~~ claim 51, further comprising the step of getting a zip code to which the multiple brand order is to be delivered and a brand of at least one respective good in the multiple brand order.

58. (previously presented) The method of managing the delivery schedule as recited in claim 57, further comprising the step of getting each of the supplier ship schedule based on the zip code and the brand of the at least one respective good ordered.

59. (previously presented) The method of managing the delivery schedule as recited in claim 58, further comprising the step of selecting the respective delivery agent and the respective capacity matrix based on the zip code of the multiple brand order.

60. (previously presented) The method of managing the delivery schedule as recited in claim 59, further comprising the step of determining a first potential ship date to the respective buyer's address based on the capacity of the respective delivery agent and the delivery schedule of the respective delivery agent.
